

Working Prototype Known Problems Report

SocialShopper

KMS Inc.

12/01/2019

Known Bugs:

- "Items" array does not initialize correctly when creating a list with other participants
- Sometimes if there is a bunch of lists, clicking one takes you to the wrong one
- Adding a friend to the friends list from the list set up page doesn't add them to the friends list in the user's section of the database.
- ~~— When adding users to a list it displays the UID and breaks the names up into different checkboxes.~~
- Deleting a list sometimes doesn't delete the correct list
- Opening friends list after creating new user displays does not get the display name
- Adding an item from the mock store to the list items may cause an overflow by having too long of a description of an item.
- User can be deleted from the list set up and can't be added back.
- The file can still be created with zero participants.
- The order in which you check mark users for an item matter. It matters because it could have a new item with the values (x,y) and you want to add more quantity to the item and you select the values are (y,x) it won't add to the already existing one, but rather create a new one.

Fixed (since 12/01/2019):

- ~~— Deleting a list from the "Lists" view does not delete the list id from the user's page in firebase~~
- ~~— Searching for a user by name in 'add a friend' causes null errors~~ (This was happening because there were users with no field 'displayName' in the data)

Acceptance Criteria:

- Can the User create an account in the App?
- Can the User log-in with a Google account?
- Can the User create a list by themselves?

- Can the User add a friend to their account?
- Can the User create a list with their friend?
- Can the User set a budget on the list for the whole group?
- Do the Users lists stay in their account even after they log out?
- Do the Users friends stay in their account even after they log out?
- Does the app display the individual totals for all of the participants?
- Does the app allow the User to open Venmo or CashApp within the app?
- Can the user manually enter an item into their list?
